Problem 1

Give an appropriate positive constant c such that $f(n) \le c \cdot g(n)$ for all n > 1.

1.
$$f(n) = n^2 + n + 1$$
, $g(n) = 2n^3$

2.
$$f(n) = n\sqrt{n} + n^2$$
, $g(n) = n^2$

3.
$$f(n) = n^2 - n + 1$$
, $g(n) = n^2/2$

Solution

We solve each solution algebraically to determine a possible constant c.

Part One

$$n^{2} + n + 1 =$$

$$\leq n^{2} + n^{2} + n^{2}$$

$$= 3n^{2}$$

$$\leq c \cdot 2n^{3}$$

Thus a valid c could be when c = 2.

Part Two

$$n^{2} + n\sqrt{n} =$$

$$= n^{2} + n^{3/2}$$

$$\leq n^{2} + n^{4/2}$$

$$= n^{2} + n^{2}$$

$$= 2n^{2}$$

$$\leq c \cdot n^{2}$$

Thus a valid c is c = 2.

Part Three

$$n^2 - n + 1 =$$

$$\leq n^2$$

$$\leq c \cdot n^2/2$$

Thus a valid c is c = 2.
